SAFETY IN COLOURS

**TraffiGLOVE**<sup>®</sup>

CUT 1

3131 Gripper

CE TG165-9

In many different markets today there is an increasing report of injuries to cut and abrasion when not operating a compliant glove policy. You may have already been through the process of launching a mandatory glove policy or may be still considering the options.

Whatever the history...

Today you are presented with the worlds most innovative colour coded glove system. Designed to protect the workforce from cut and abrasion, by the understanding of colour – **TRAFFIGLOVE®**.

#### UNDERSTANDING INDUSTRY TYPES

Traffisafe UK have launched the new range to market following years of experience and research in the construction market. We now present you the simplest concept you can imagine, that will be understood by all nationalities and ages; such an endless range of choice is a real problem for so many. The obvious answer is colour.

#### BENEFITS IN SAFETY

Understanding the differences between glove styles, when there seems to be such an endless range worldwide can be the problem for so many contractors and safety managers. To educate the workforce in different areas for cut, abrasion, tear and puncture resistance across say 10 different products presents most principle contractors with a daunting task.

#### TECHNICAL INFORMATION

The gloves used widely in the industry today meet the EN388 standard. This standard tests for abrasion, cut, tear and puncture. The results of this testing process are shown with the 4 numbers underneath the shield symbol.

It is crucial that the wearer has a grasp of the protection offered by the glove and the education process often requires toolbox talks, presentations on site – but how much do the workforce remember next week? Usually very little. They are skilled trades that are focussed on achieving quality output and often ignore technical details, such as EN388 ratings.

The immediate, undeniable benefit of Traffiglove® is that the colours are instantly recognized and the cut level is also marked in bold on the glove print.

#### HUGE ADVANTAGES IN SAFETY THROUGH COMPLIANCE

We believe that every accident is avoidable. Injury to hands is still the highest RIDDOR reported accident. Our hands are usually at the forefront of the task in hand.

Colour recognition is instant. Raising awareness and enabling simple, straightforward compliance is the first and easiest way to **stop** hand injury.

Different coatings also offer extra advantages in grip and dexterity, so ask for samples before you make a decision on the right glove for you.

The guide below serves as an example of how we look to work with you, to develop your company task specific guide.

**RED CUT LEVEL 1** Minimum Protection  
Groundworkers, Carpenters, External Works.

**AMBER CUT LEVEL 3** Intermediate Protection  
Internal Fit Out Teams, Roofers, Electricians.

**GREEN CUT LEVEL 5** Highest Protection  
Glaziers, Metal Workers, Steel Workers, Tilers.

# RED<sup>★</sup>
